1 Introduction

Managing a dental clinic may be cumbersome at times, the paperwork that the receptionist have to do and the time patients have to spend waiting on the queue just to make an appointment. DCMS is system that will remedy this situation.

1.1 Purpose

The purpose of this document is to provide a detailed description of the DCMS ,a web application. It will give in detail the purpose of the system, features of the system and the constraints under which the system will operate.

- Developers-It will provide guidelines for them on features to develop and help plan accordingly which functional requirements will need to be implemented. It will facilitate the programming process.
- Testing/Quality assurance team-It will assist them in putting together the testing plan and identifying bugs in the software.
- Product Owner(Client)- It will help verify the project deliverables and have documentation that outlines what the software will do.

 (CHANGE THIS, could add end user)

1.2 Scope

DCMS (Dental Clinic Management System) is a web application that provides support for managing the services of a small dental clinic.

1.2.1 Software Benefits and Objectives

The software is aimed at replacing manual paper systems that currently exists at a dental clinic. Users will remotely have access to relevant services

based on requirements. Having a digital filing system will reduce human error by having text validations before data is captured. Having database will allow for backups.

1.2.2 Users Roles

There are four basic users namely Dentist, patient, Receptionist and Administrator. Each of these user roles will have different goals when interacting with the software.

- A Dentist can login ,view and set their own schedule of appointments. Write out a prescription for a patient and view a patient's profile(medical record).
- A new patient provides personal details to register as a patient on the system.Returning patients do not need to register, they just login using their username and password. They can also at any time update those personal details. They can then book an appointment. Patients can view their health records, prescriptions, medical expenses and comment on the services provided.
- The receptionist logs in with their username and password, views and manages appointments, performs day open and close activities. He also sends reports to admin and help with registering those patients who that are having problems with registering.
- The administrator has the authority to add or remove a doctors and receptionist. He grants permission to receptionist and dentists the authority to view and generates report. He also has the authority to add or delete patients from system. He also manages the system

1.3 Definitions, Acronyms and Abbreviations

Term	Definition
DCMS	A Dental Clinic Management System application
User	Anyone who will be interacting directly with the sys-
	tem
Netbeans	an integrated development environment for java
Java	A general-purpose computer-programming language
	that is concurrent, class-based, object-oriented
PHP	Hypertext Preprocessor is a server-side scripting lan-
	guage designed for web development.
Json	JavaScript Object Notation is an open-standard file
	format that uses human readable text to transmit data
	objects consisting of attribute-value pairs and array
	data types

1.5 Overview

Front End tasks: This involves the making of User Interfaces. These are the screens that the users will be seeing when using the system.

- Create Patient(Input will be patient details)
- Log in(Username and Password)
- Create Appointment(PatientId and Date/Time)
- Create Bill(PatientID, DoctorID and Consultation Details)
- View Schedule(DoctorID and Date/Time)
- View Bill(PatientID)

Back End tasks:

- Create Database with table and entities as listed in ERD
- Use back-end frameworks to build server-side software. PHP and JSON
- Cloud computing integration-Allowing Database to be accessed remotely.

1.5.1 Existing System

The present system is manual based. It involves paper work in the form of mantaining files, making appointments and billing. The manually based system has the following disadvantages:

- it is a limited system.
- looking for a patient's file may take a long time
- patients have to queue to make an appointment
- There is no backup files.

- files are prone to damage.
- editing file problems. storage space may be limited.
- Patient's personal information is not protected, it can be accessed by anyone.

1.5.2 Proposed System

DCMS is an automated system that can be accessed via the internet.It has the following advantages.

- Easy to store and search for files.
- Patients can make appointments online and avoid long queues.
- Each patient has a profile that can only be accessed by authorized users i.e(doctor or receptionist).
- The system can be accessed remotely.

2 Overall description

2.1 Productive perspective

DCMS is a web application that will work on any device that can access the internet and meet the minimum specifications.

2.1.1 Architecture

Figure 1: architecture

2.1.2 Entity Relationship Diagram

Figure 2: DCMS-ERD

2.1.3 Software Tools

• Database Server: Microsoft SQL Server

• Client: Any web browser

• Programming Language:Java

• Development Tools:Netbeans IDE 8.2

2.1.4 Hardware Requirements

The supported Operating Systems:

• Microsoft Windows Vista SP1/Windows 7 Professional:

- Processor: 800MHz Intel Pentium III or equivalent

- Memory: 512 MB

- Disk space: 750 MB of free disk space

• Ubuntu 9.10:

- Processor: 800MHz Intel Pentium III or equivalent

- Memory: 512 MB

- Disk space: 650 MB of free disk space

• Macintosh OS X 10.7 Intel:

- Processor: Dual-Core Intel

- Memory: 2 GB

- Disk space: 650 MB of free disk space

• Smartphone Requirements:

- Android running OS 4.0+

- iPhone running iOS 8+

- Windows Phone 8.1+

2.2 Product functions

DCMS will enable patients to book or make appointment and the output will the be date and time in which it is inline with the Doctors schedule. System will also provide a clear schedule which allows patients to see which Doctor is available at a particular slot. Who ever will be using the system has to go through registration first if he/she is first time user or login by providing username and password to access the DCMS. The system allows patients to request their bill and the patient can view or print the through system.

2.3 Business Rules

- Before a user can log in, they are required to be an existing user on the System. Existing users access the system (log in) using username and password.
 - New Dentists and Receptionist's require an Administrators authorization to be registered on the system.
 - A new patient is required to enter their personal and medical details.
- An Appointment must be booked by the patient. They have the options of doing so telephonically (Where the receptionist will be the one capturing the appointment) or engaging directly with the system. Booking of an appointment requires viewing the relevant dentist's schedule to identify available slots.
- A Dentist can view their schedule. This means viewing all the appointments that have been booked for the doctor and displayed as of their requirement either Daily, Weekly or Monthly schedule calendar view.
- A consultation is created by a dentist. This follows the arrival of a
 patient for their appointment and discussions or dental procedures are
 conducted and recorded. A consultation can also be recorded for a
 patients failure to arrive for an appointment without cancelling. This
 consultation type is labelled as missed appointment.
- Generating Bill follows a consultation, this is where all the costs of the medical procedure are recorded. This may also include the recording of a missed appointment charge.
- Authorization is done by an administrator. This is required when new a receptionist or dentist is created. Similarly so when it will be updated or deleted.

2.3.1 Use Cases

Actor	Description	
Receptionist	May assist patient with registration and booking,	
	should they require assistance.	
Administrator	Administrator is responsible for Doctors registration	
	and other issues that directly related to the system	
	like update or archive if necessary.	
Patient	Patient may directly interact with the system during	
	registration or booking process, depending on the pa-	
	tient's level of of computer literacy	
Doctor	May set appointment with the patient, depending on	
	patient's problem	

Use Case	Description	Related Use case and

3 Fully Dressed Use Case

3.1 Create Patient Use Case

Use case name:	Create Patient
Scope:	Dental Clinical Management System for better health.
Triggering	User request to create patient.
Event:	
Brief descrip-	user request to create a new Patient profile. Either
tion:	the Patient themselves via mobile phone, desktop, self-
	service terminal or Receptionist on behalf of the Pa-
	tient.A form is displayed and prompt for the comple-
	tion of all relevant data, including: The Patient's first-
	name, lastname, ID number, date of birth and email(if
	applicable). A prompt to confirm and save the profile
	is displayed. The user can double-check the entered
	data and confirm the creation of the profile. The pro-
	file is then created by creating a new record in the
	Patient table in the data store. Login details are gen-
	erated and sent to the patient.
Actor(s):	Patient (Primary), Receptionist (Primary)
Doloted	NT / A

cases: Stakeholders and interests:	1. Patient - wants all their demographic data (first- name, lastname, ID number, date of birth, mobile number and email address(optional)) to be accurately captured to ensure the completion of their profiles. 2. Receptionist - wants to accurately capture Pa- tient's demographic data (firstname, lastname, ID number, date of birth, mobile number and email ad- dress(optional)) on behalf of a computer illiterate Pa- tient.
cases: Stakeholders and interests: Pre-condition:	1. Patient - wants all their demographic data (first-name, lastname, ID number, date of birth, mobile number and email address(optional)) to be accurately captured to ensure the completion of their profiles. 2. Receptionist - wants to accurately capture Patient's demographic data (firstname, lastname, ID number, date of birth, mobile number and email address(optional)) on behalf of a computer illiterate Patient. N/A

3.2 Create Appointment Use Case

Use case name:	Create Appointment
Scope:	Dental Clinical Management System for better health.
Triggering	user request to create Appointment.
event:	
Brief descrip-	user request to create new Appointment. This involves
tion:	Doctor's schedule where patient can select date and
	time available in the slot. Receptionist may also cre-
	ate appointment on behalf of patient. in case of emer-
	gency or serious problem depending on the condition
	of a patient a Doctor may also create appointment.
	Patient ID must be read first then time and date has
	to be selected on the Doctor's schedule and after suc-
	cessful booking confirmation message has to be gener-
	ated and sent to the patient via email.
Actor(s):	Patient (primary), Doctor (primary), Receptionist
	(primary).
Related use	Read Patient (includes), create consultation (ex-
cases:	tends).
Stakeholders	Patient- wants to make sure that appointment is done
and interests:	accordingly. 2. Receptionist- wants to accurately
	make appointment on behalf of those patients who
	have lack of computer skills. Doctor - wants to make
	appointment that is urgently and need serious atten-
	tion.
Pre-condition	Patient must exist in the database.
Post-condition	Confirmation message must be send via email.

3.2.1 Use Case Diagram

Case Diagram.png

Figure 3: DCMS-ERD

3.3 Constraints

- DCMS must run on any platform that supports Java.
- Data captured should be stored on a cloud database.

• The user needs to be connected to the internet.
